

Experimental Phasing

Airlie McCoy

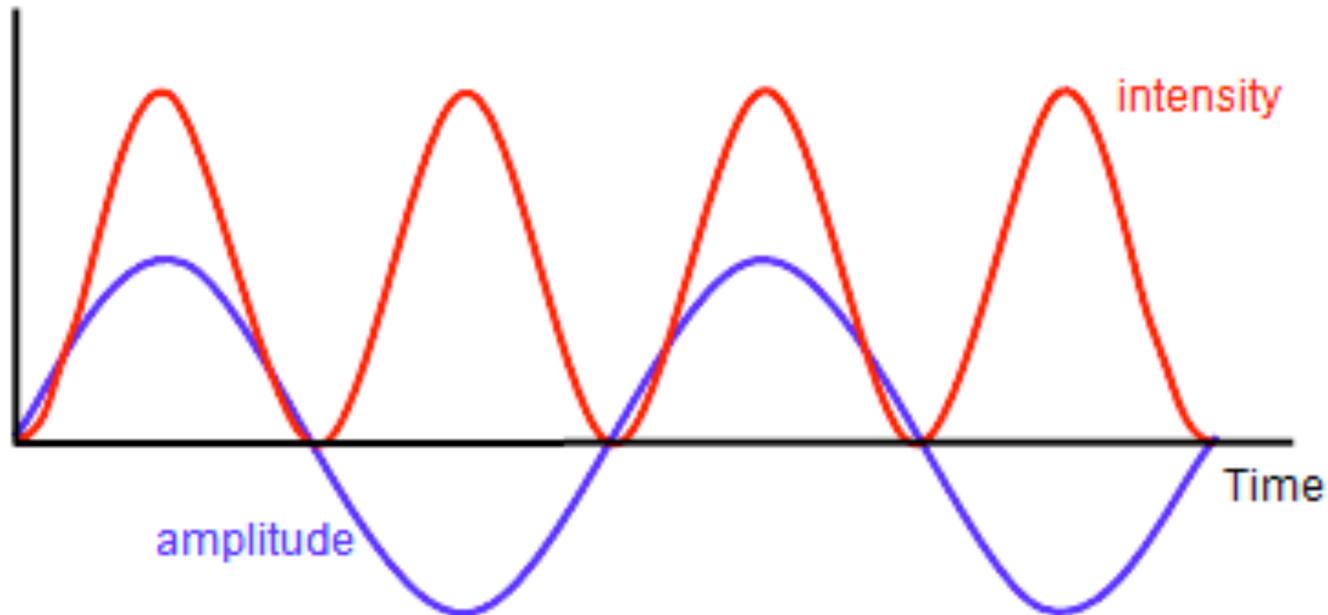

UNIVERSITY OF
CAMBRIDGE

Interference

- X-ray detectors only detect X-ray intensities

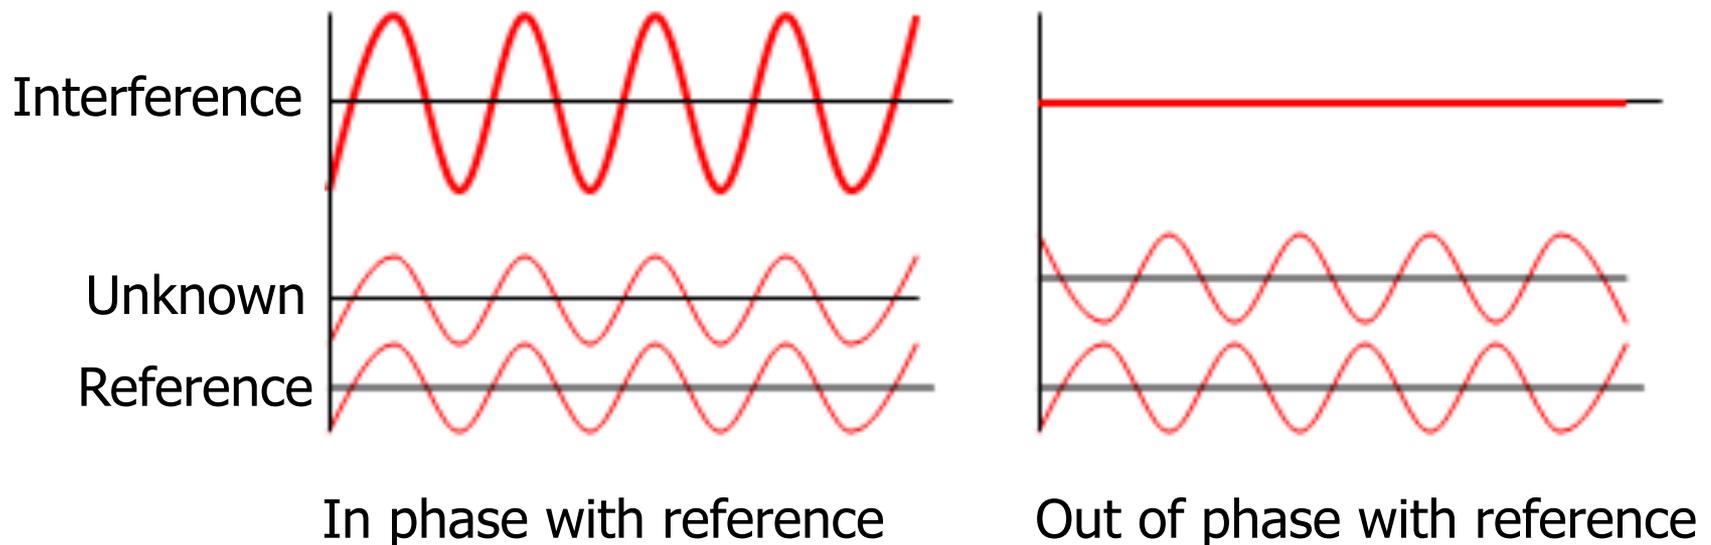

$$E \propto A^2$$

because they respond to the energy of the wave

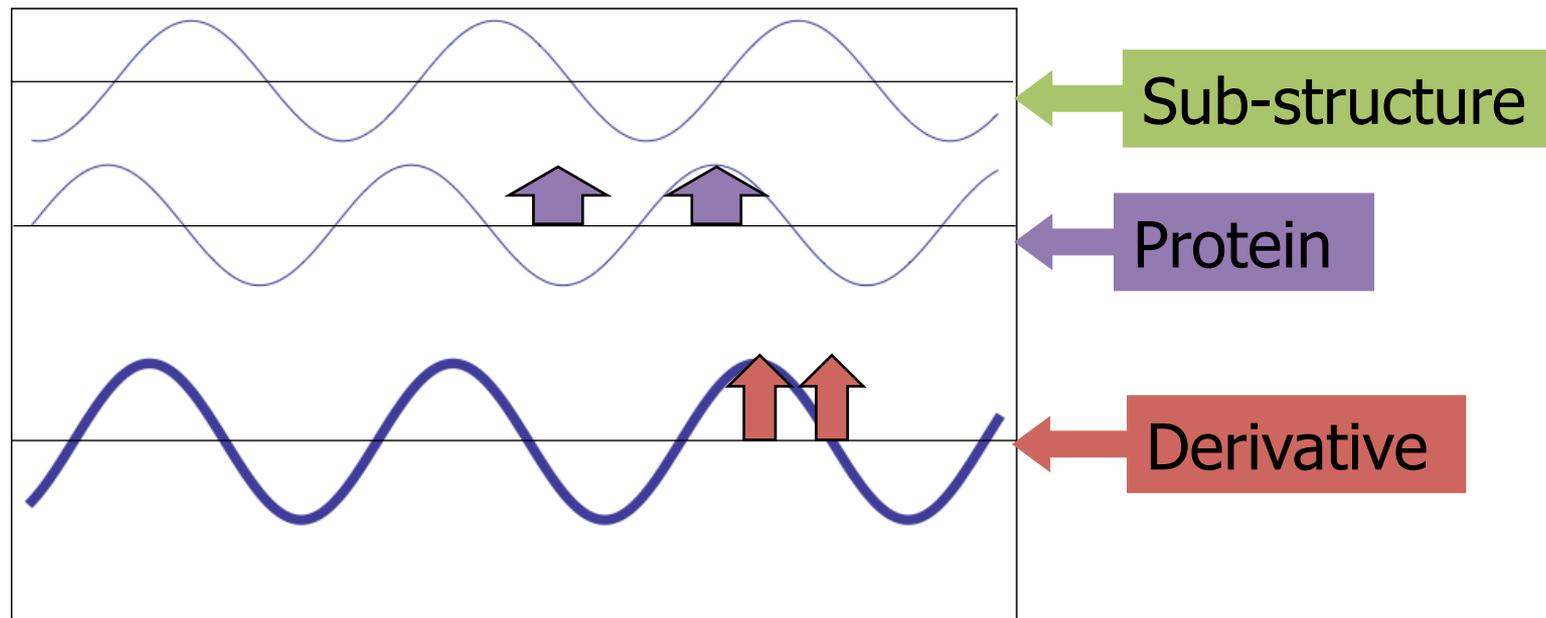

Reference Wave

- To phase a wave of known amplitude by interference, look at the amplitude of the wave after interference with a **reference wave** of known phase and amplitude

Interference and Phase

- The phase and amplitude of the reference wave are known from calculating them from a substructure of atoms

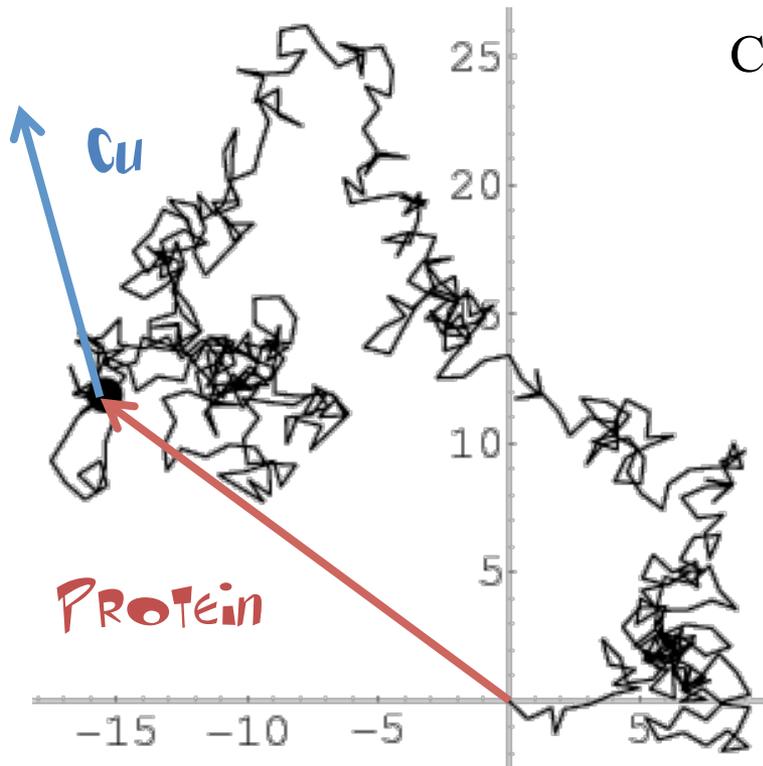

Substructure determination

- How do you determine the substructure?
 - If you had the intensities of the substructure atoms floating in space you could solve the substructure
 - Patterson methods
 - Direct methods
 - Dual space methods
 - **PROBLEM**
 - You don't have these intensities!
 - **SOLUTION**
 - Use approximations (see e.g. Blundell & Johnson 1976)
-

Heavy Atom Scattering is Significant

- How can e.g. a single Cu atom in a 100 kDa protein make any difference to the intensities?
- Structure factors add up as a “random walk”

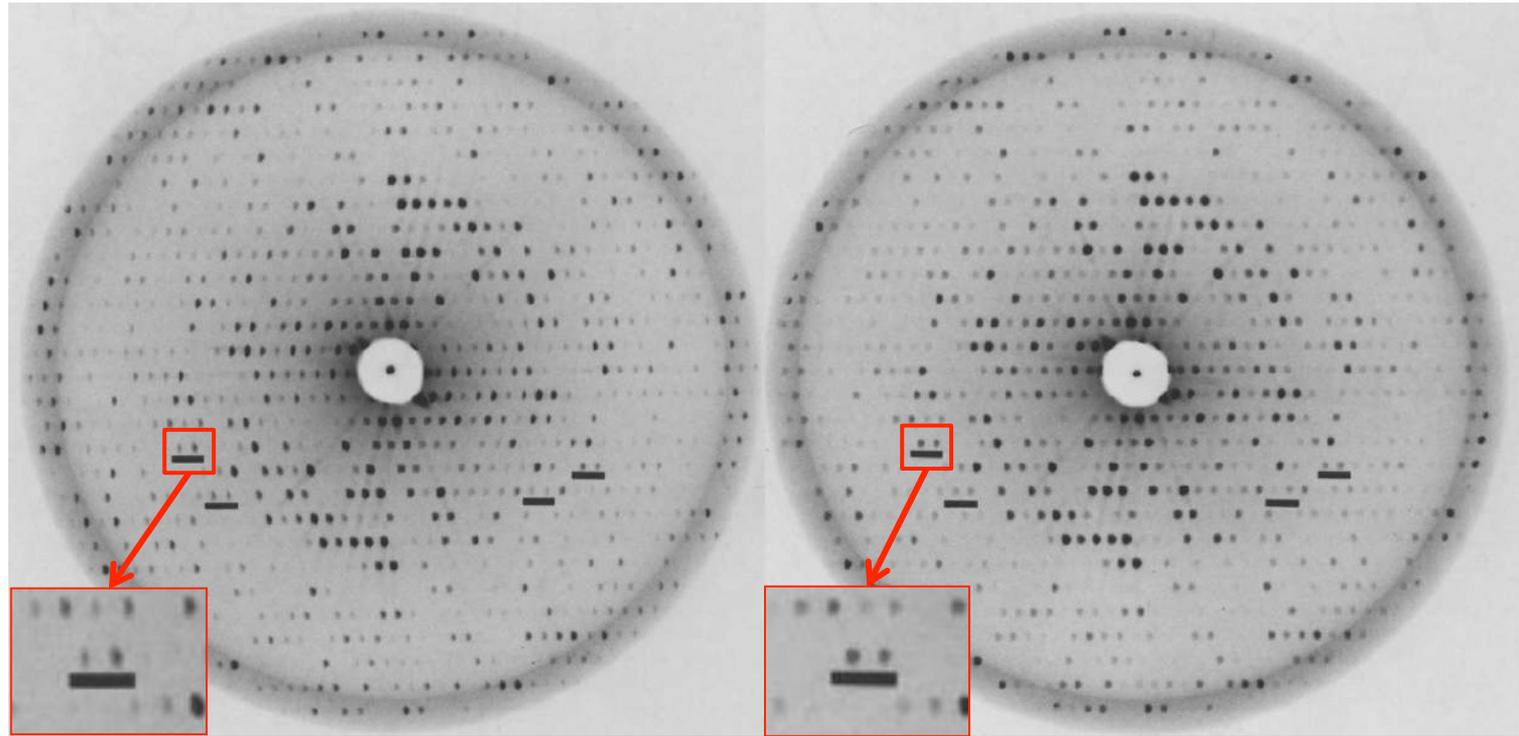

Crick and Magdoff (1956)

$$\frac{\langle \Delta F \rangle}{\langle |F| \rangle} = \frac{Z_H}{Z_{\text{eff}}} \sqrt{\frac{2N_H}{N_p}}$$

N_h , N_p are number of heavy, protein atoms
 Z_h , Z_{eff} are atomic numbers of heavy atom
and average of protein atoms (~ 6.7)

100 kDa protein with Copper ($Z=28$)
5.6%

Native

Heavy atom derivative

Intensity reversals (underlined)
indicate heavy atom has bound

Isomorphous Replacement

- Native and derivative must be **isomorphous**
 - Same unit cell and space group
 - Same position and orientation of protein in unit cell
 - Can require searching many different compounds to find one or two isomorphous ones
 - Merge datasets from different crystals
 - e.g. BLEND to find isomorphous (partial) datasets
-

Isomorphous replacement

The main constituents of organic matter

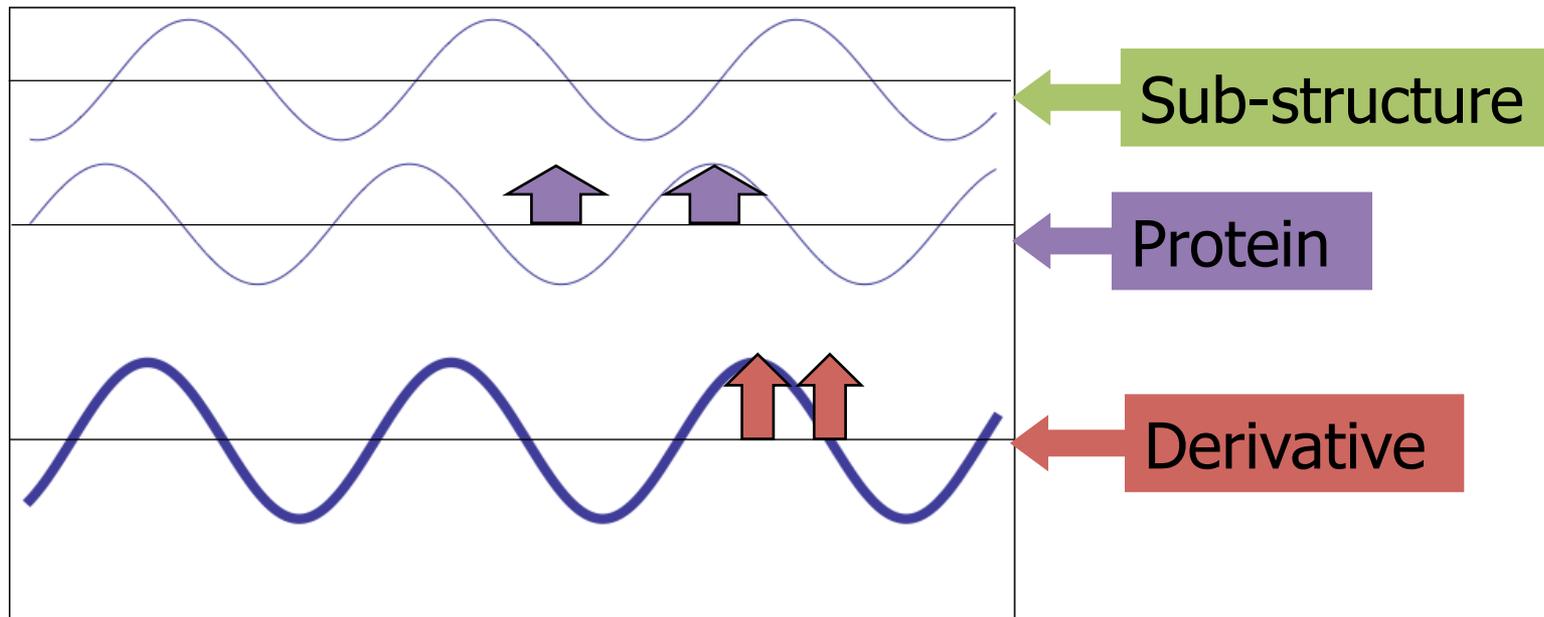

H																		He
Li	Be											B	C	N	O	F		Ne
Na	Mg											Al	Si	P	S	Cl		Ar
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br		Kr
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I		Xe
Cs	Ba	La	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At		Rn
Fr	Ra	Ac																
		Th	Pa	U														

Classic heavy-atoms – isomorphous signal

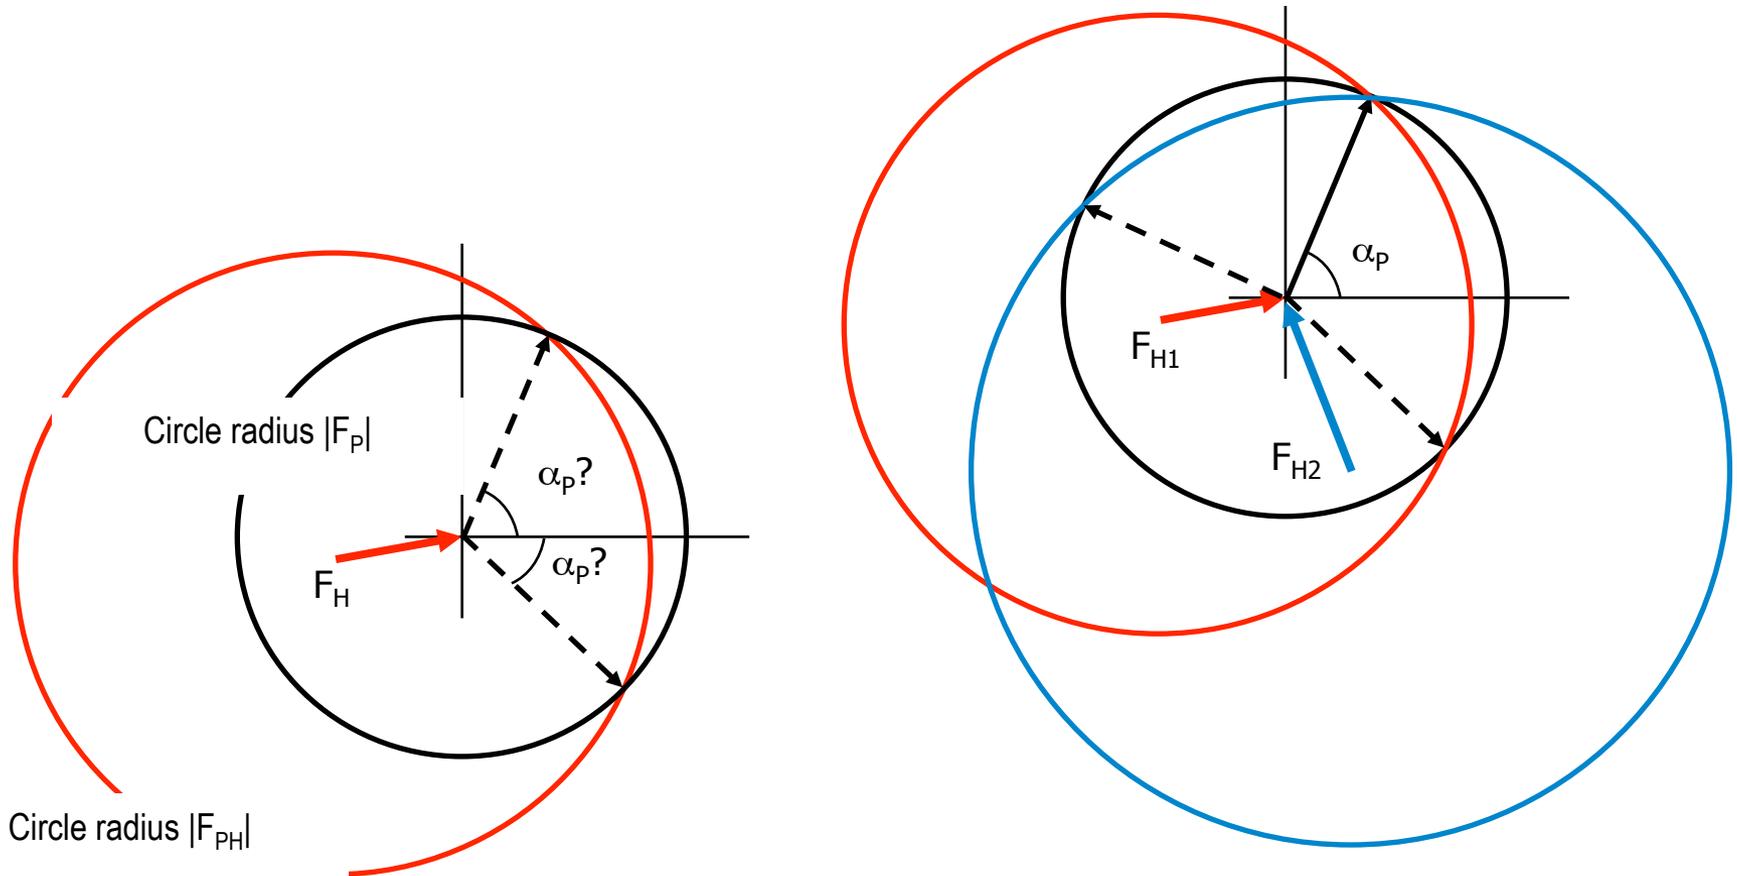

Gaseous inert heavy-atoms

Harker Diagrams

- Two solutions for phase of unknown wave
- Also two solutions for phase of interference wave

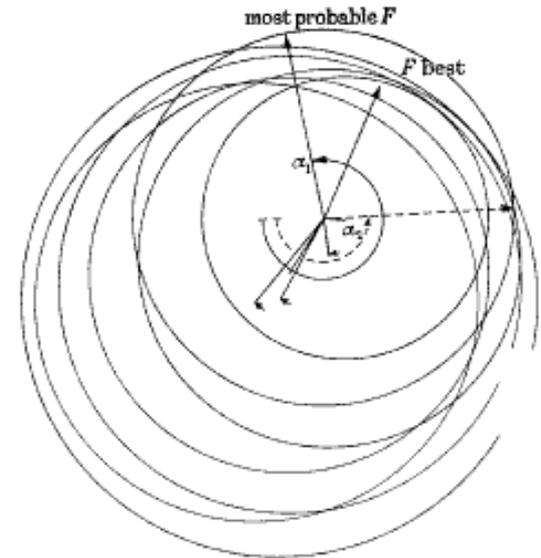

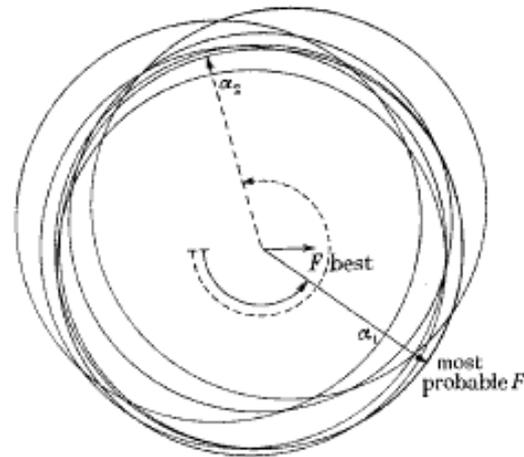

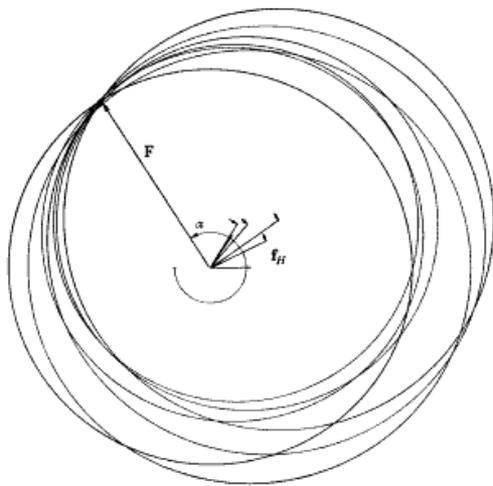

Harker Diagrams

Reality...

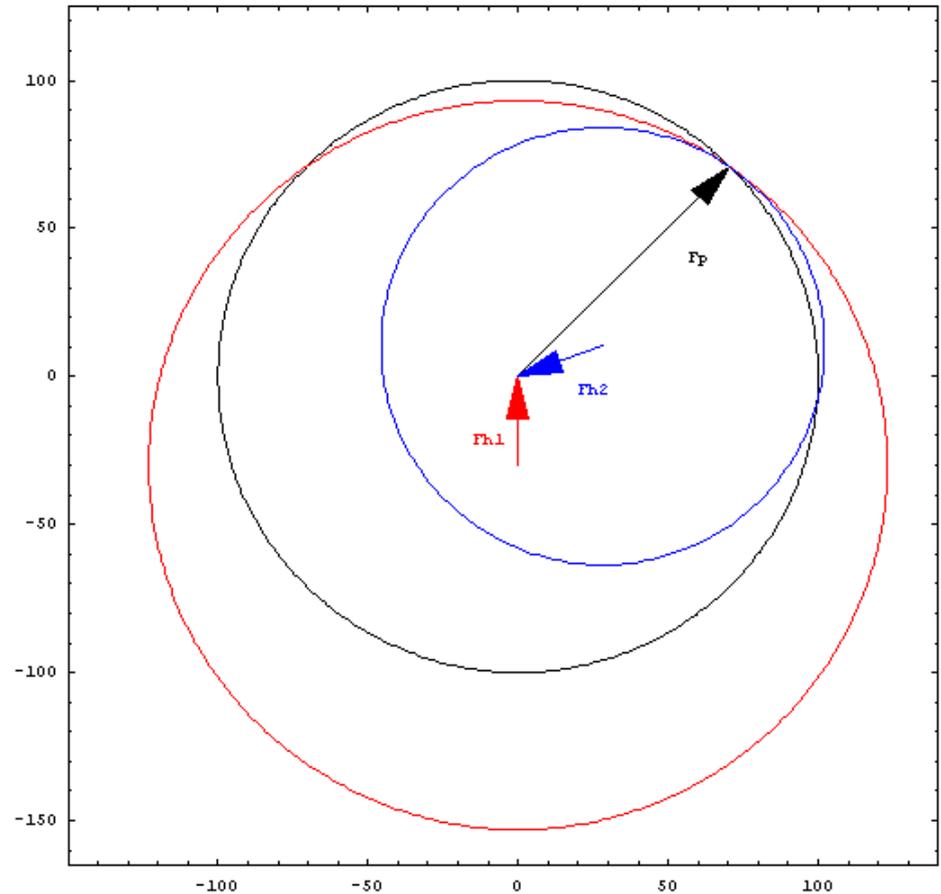

- Some real Harker diagrams from the phasing of haemoglobin with 6 derivatives

- Phase circles rarely cross exactly
- Need a **probabilistic** approach to determining the phase

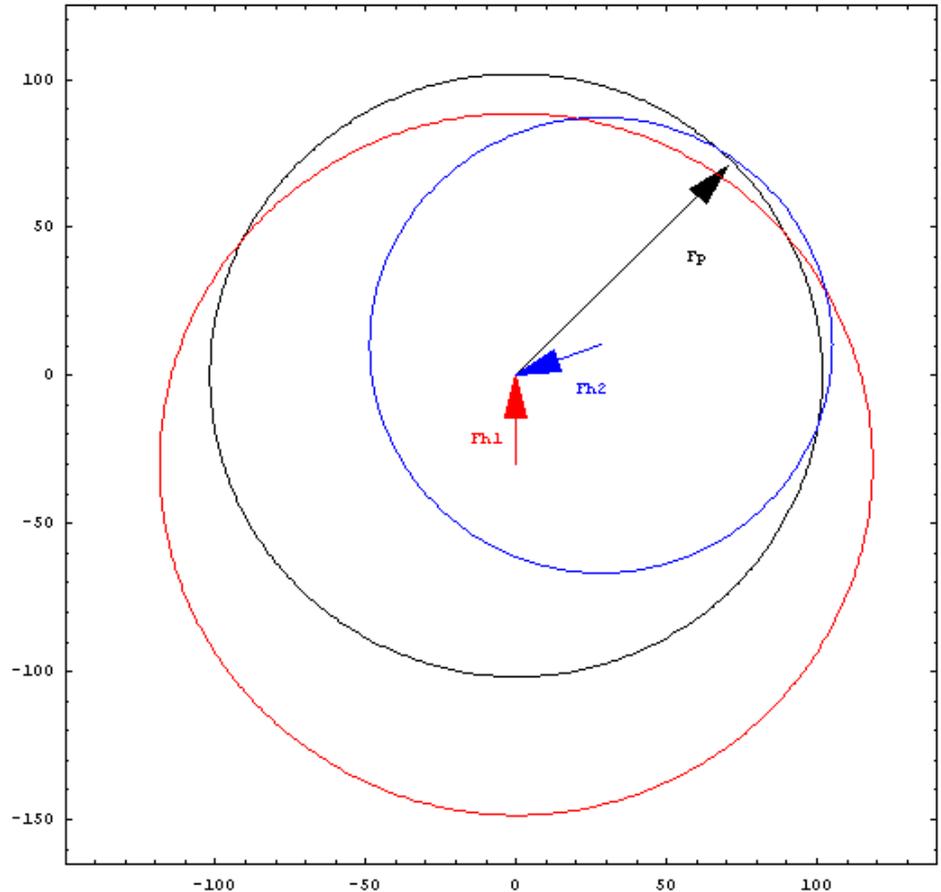

Harker construction

- Phasing of one reflection using two derivatives with no errors
- Phase determined with very high probability

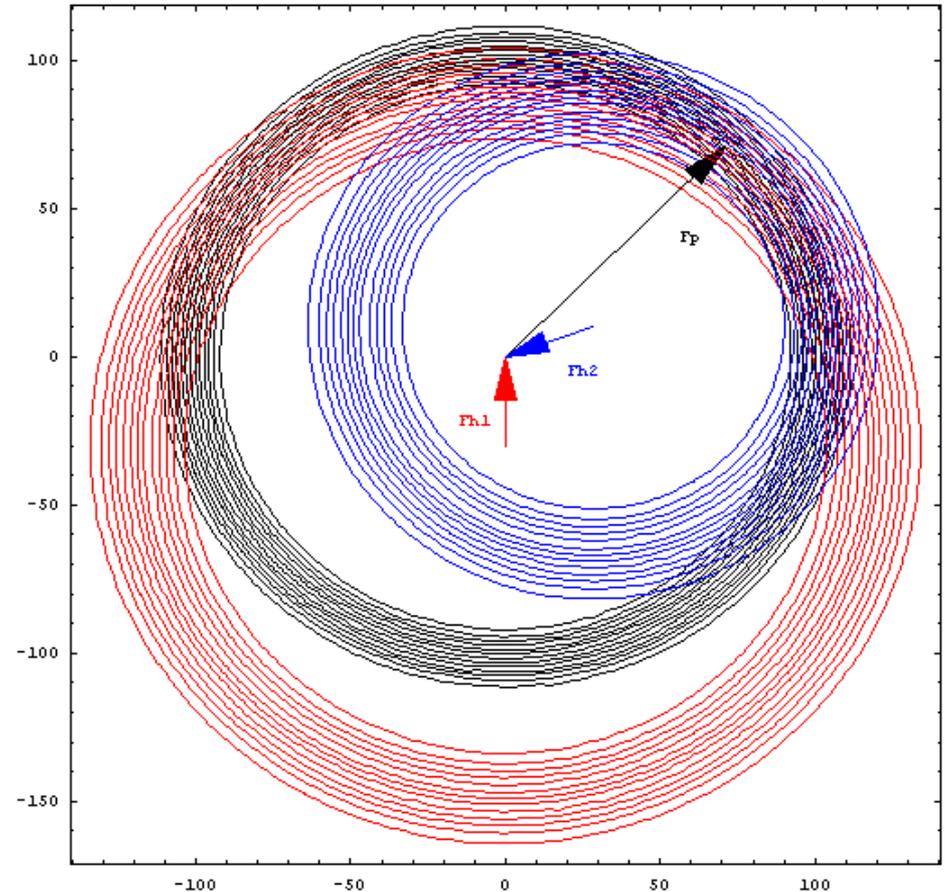

Harker construction

- There are many sources of error in the experiments
 - Mainly model errors
 - Also data errors
- The errors are large
- We are looking for the best phase
- We therefore need a probability function

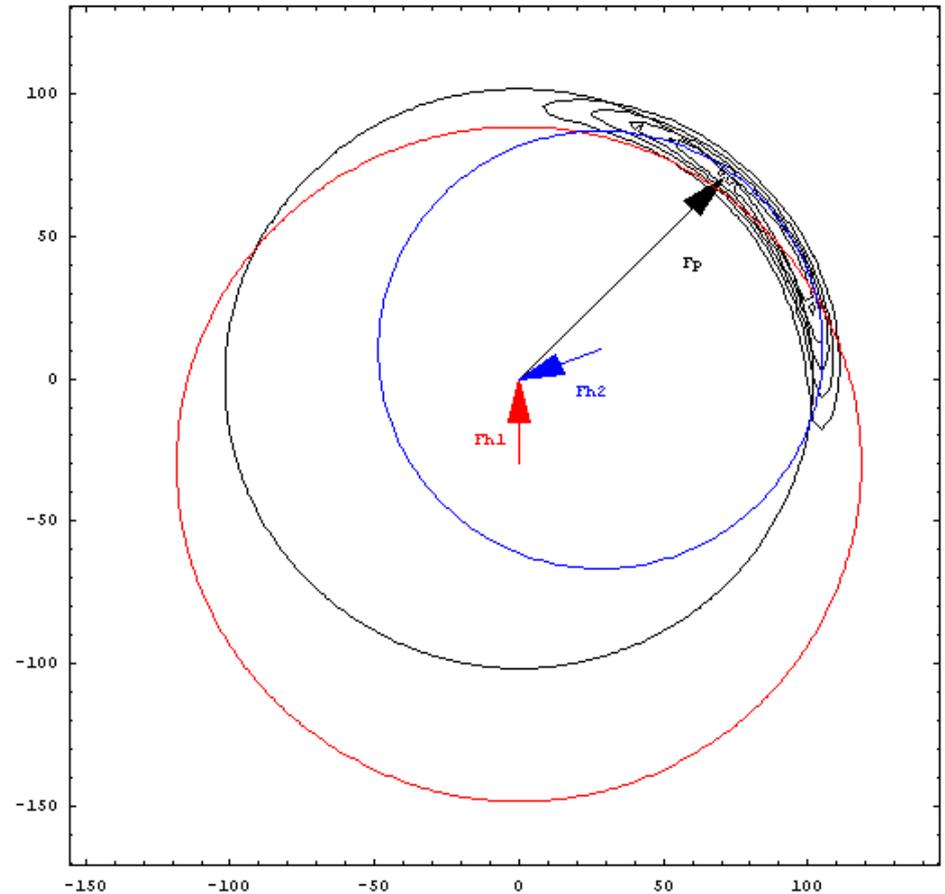

Probabilistic Harker Diagram

- Each circle has an error associated with it to give a distribution
- The total likelihood is the volume under the curve of the product of the distributions

Probabilistic Harker Diagram

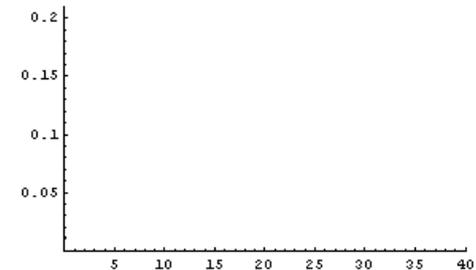

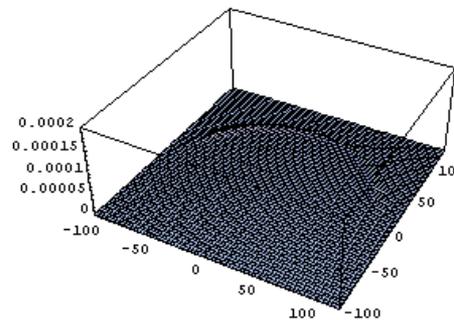

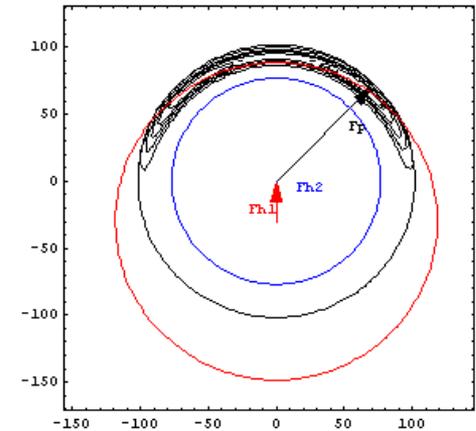

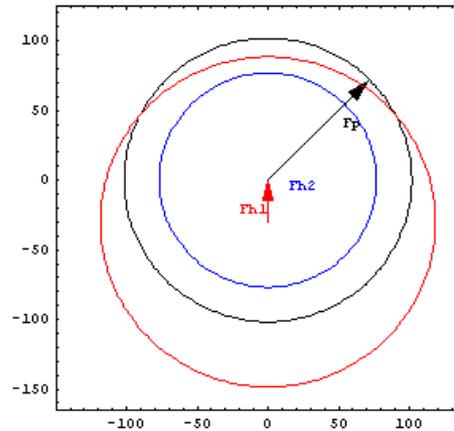

- The final distribution is high only where all three circles overlap

Refining Occupancy

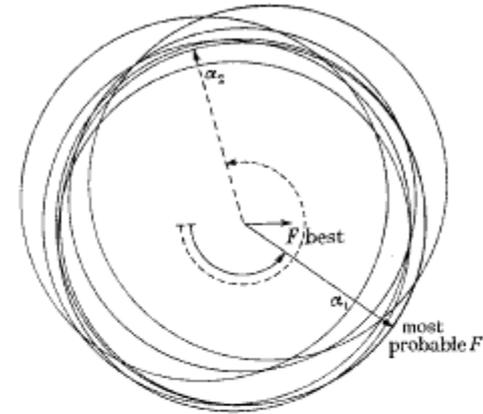

To refine the occupancy of a heavy atom, maximise the likelihood (area under the curve)

Final refined value is the optimum for ALL reflections (movie shows ONE reflection)

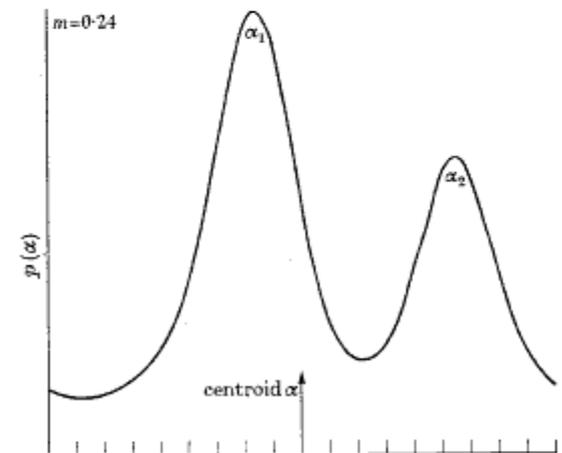

Phase probability

- Each reflection really has a phase probability density function (PDF) rather than a single phase
- This is a complicated mathematical function
 - Requires lots of memory
- Four Hendrickson-Lattman coefficients (A,B,C,D) are used to store this PDF in a compact form

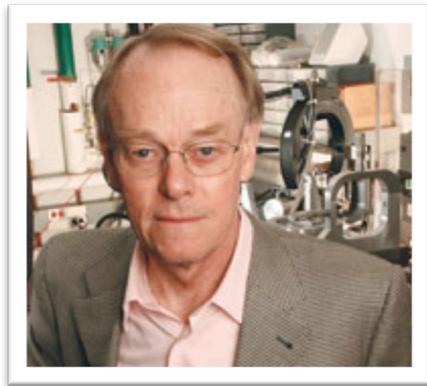

(b)

Hendrickson-Lattman Coefficients

$$P(\alpha) \propto \exp[A \cos(\alpha) + B \sin(\alpha) + C \cos(2\alpha) + D \sin(2\alpha)]$$

- HL coefficients allow for easy combination of phase information from multiple sources
 - the combined PDF is formed simply by adding the A,B,C, and D from the two distributions

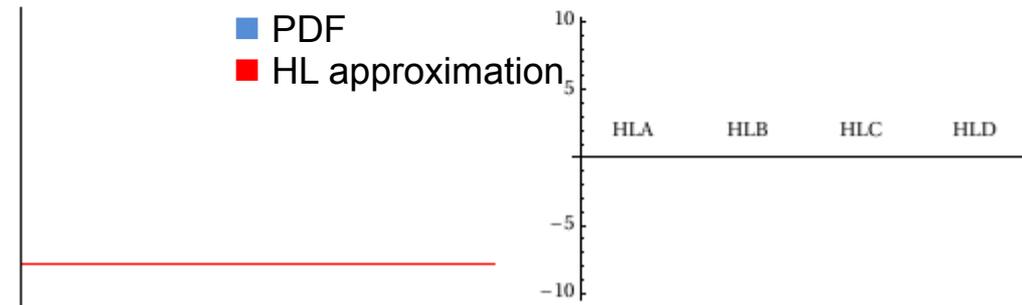

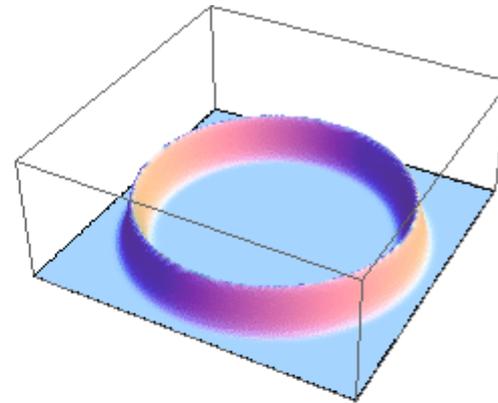

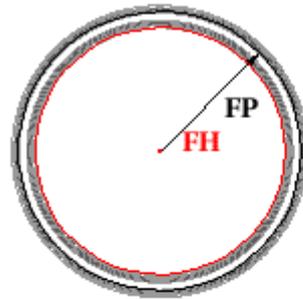

Wayne Hendrickson

Eaton Lattman

Hendrickson-Lattman Coefficients

HL coefficients as a function of F_H occupancy

MIR

SAD

SIR

SIRAS

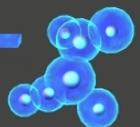

MIRAS

MAD

RIP

SAD

- The most popular way of solving structures by experimental phasing (over 70%)
- Can be done with intrinsic S and CuK α X-rays
- SAD phasing theory is very good
- Easy to automate
- Can be very fast
 - Can be done from single dataset
- May need multiple crystals
 - And careful data processing

Anomalous Scattering

A·nom·a·lous

adj.

Deviating from the normal or common order, form or rule

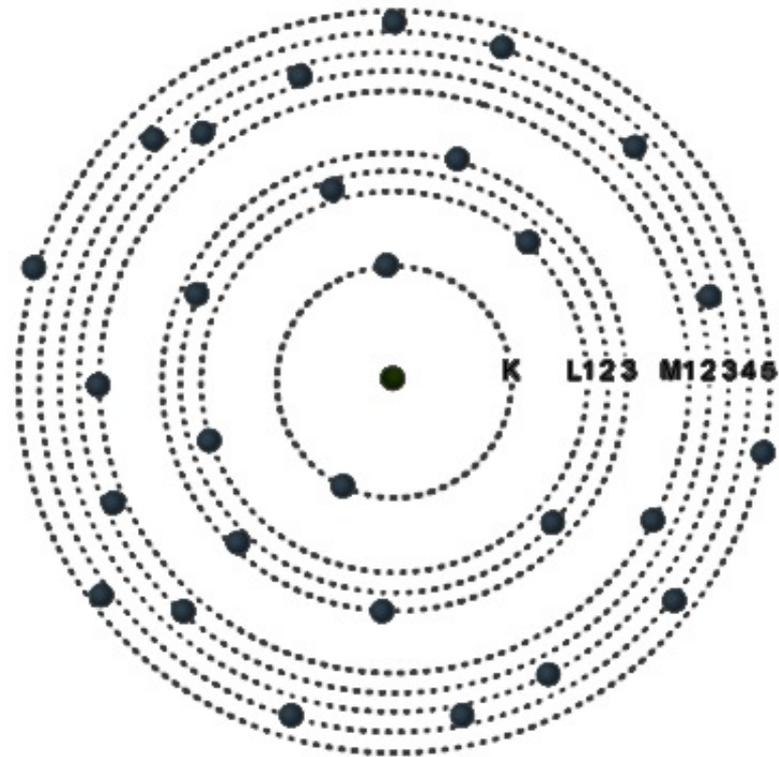

“**Anomalous** scattering” is **absolutely normal** while
“**normal** scattering” occurs only as an ideal, over
simplified model, which can be used as a first
approximation when studying scattering problems”

IUCR Pamphlet “Anomalous Dispersion of X-rays in Crystallography”

S. Caticha-Ellis (1998)

Anomalous Scattering

- Anomalous scattering is due to the electrons being tightly bound (particularly in K & L shells)
- In classical terms, the electrons scatter as though they have resonant frequencies

Wavelength Choice

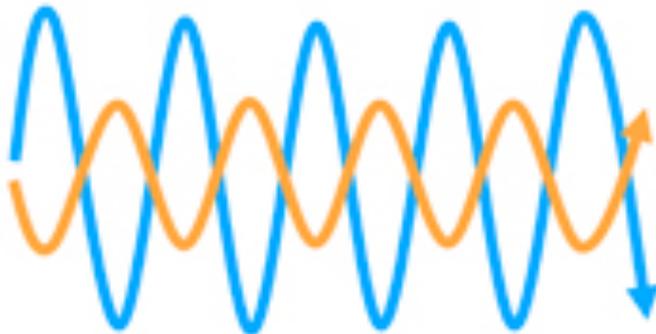

- PEAK: $|f''|$ is large
- - - INFLECTION: $|f'|$ is large
- · - · REMOTE: low energy
- REMOTE: high energy

Warning
Radiation
Damage
INCREASES
at peak

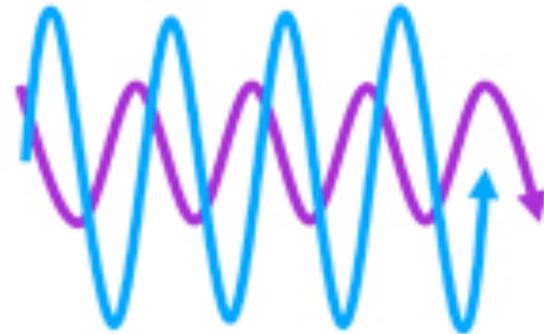

Anomalous Scattering

$$f = f_0 + f' + i f''$$

radiation normally scattered: f_0

real component: f'

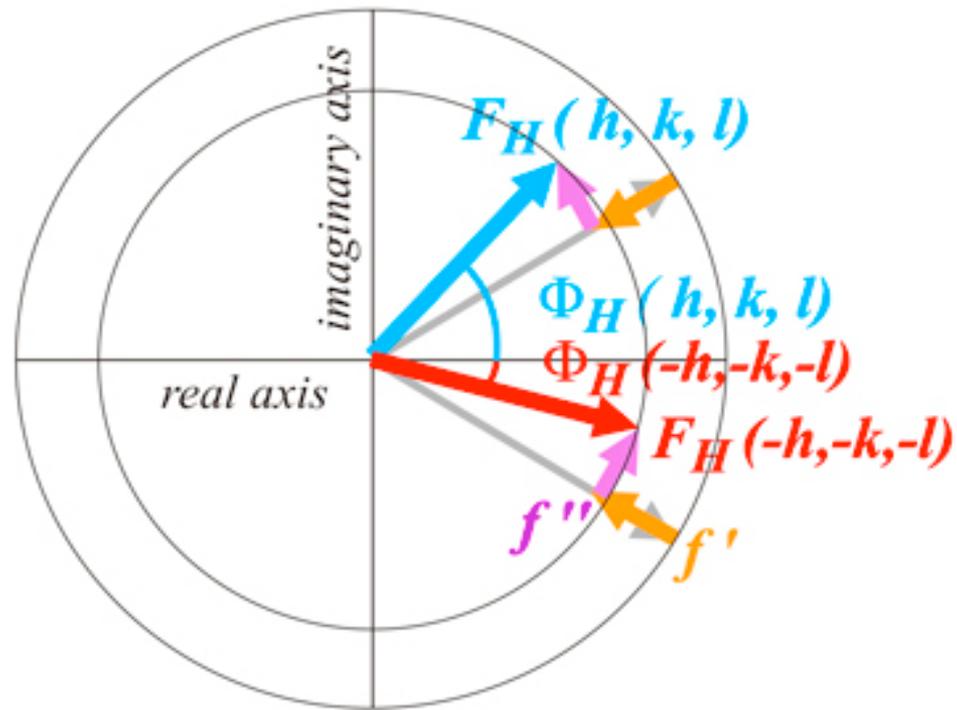

imaginary component: f''

The real component (f') is 180 degrees out of phase with the normally scattered radiation.

The imaginary component (f'') is 90 degrees out of phase.

Anomalous Scattering

$$I_H(h, k, l) = I_H(-h, -k, -l)$$

$$\Phi_H(h, k, l) \neq -\Phi_H(-h, -k, -l)$$

Anomalous Scattering

Weak anomalous scatterers at long wavelength

The main constituents of organic matter

Seleno-methionine

Useful anomalous scatterers
@ K absorption edges

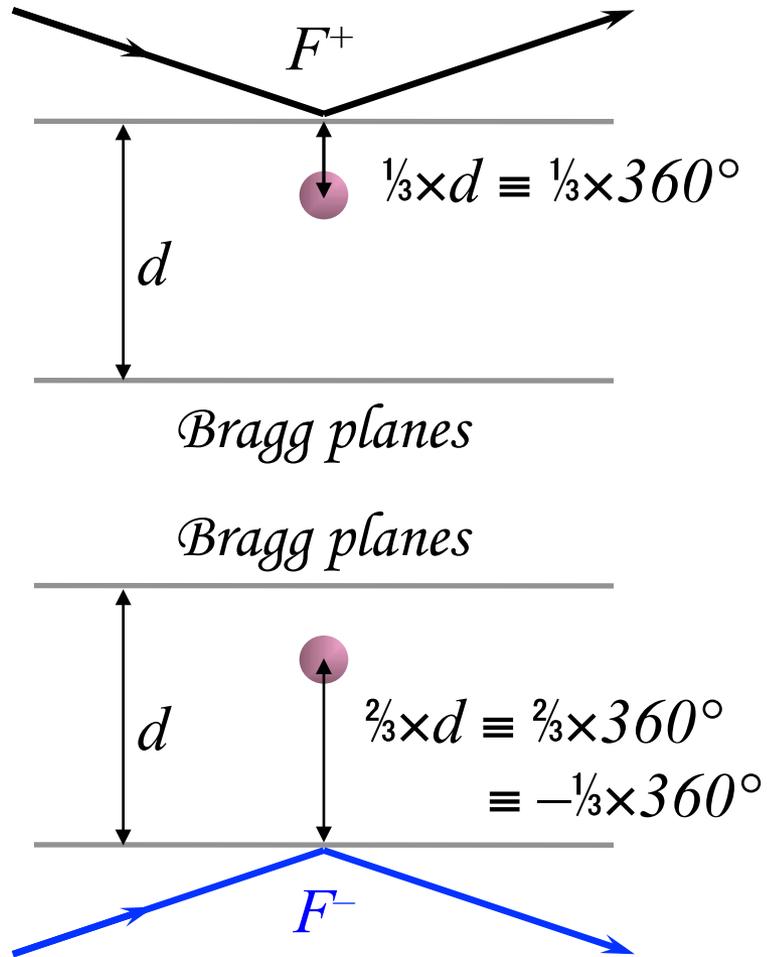

H																		He	
Li	Be																		Ne
Na	Mg																		Ar

at long wavelength

Classic heavy-atoms – isomorphous signal
& useful anomalous scattering @ L absorption edges

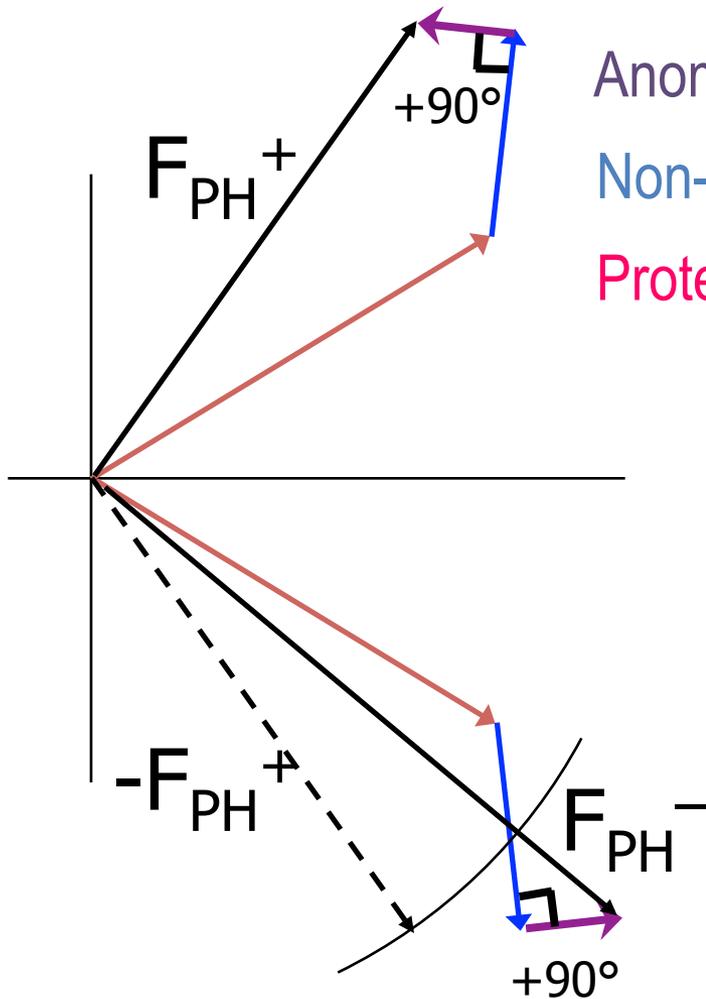

Gaseous inert
heavy-atoms

SAD Harker Diagram

- Phase of non-anomalous component depends on the atom's location between Bragg planes
- Anomalous scattering component is always advanced by 90°
 - irrespective of position of atom between Bragg planes

SAD Harker Diagram

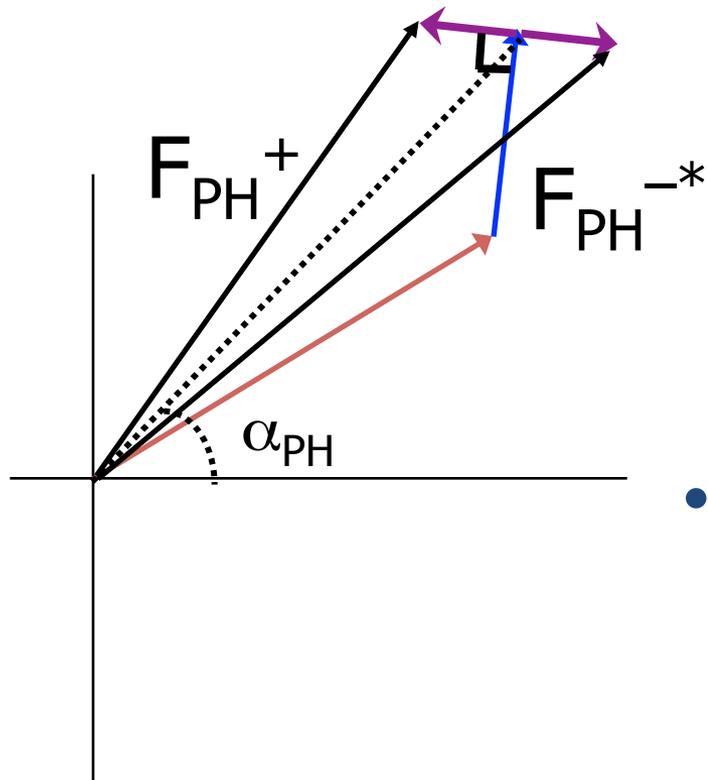

Anomalous part of heavy atom

Non-anomalous part of heavy atom

Protein (non-anomalous scattering)

- Non-anomalous and anomalous scattering components sum differently in the Friedel mates F_{PH}^+ and F_{PH}^-
 - F_{PH}^+ and F_{PH}^- have different intensities

SAD Harker Diagram

Anomalous part of heavy atom

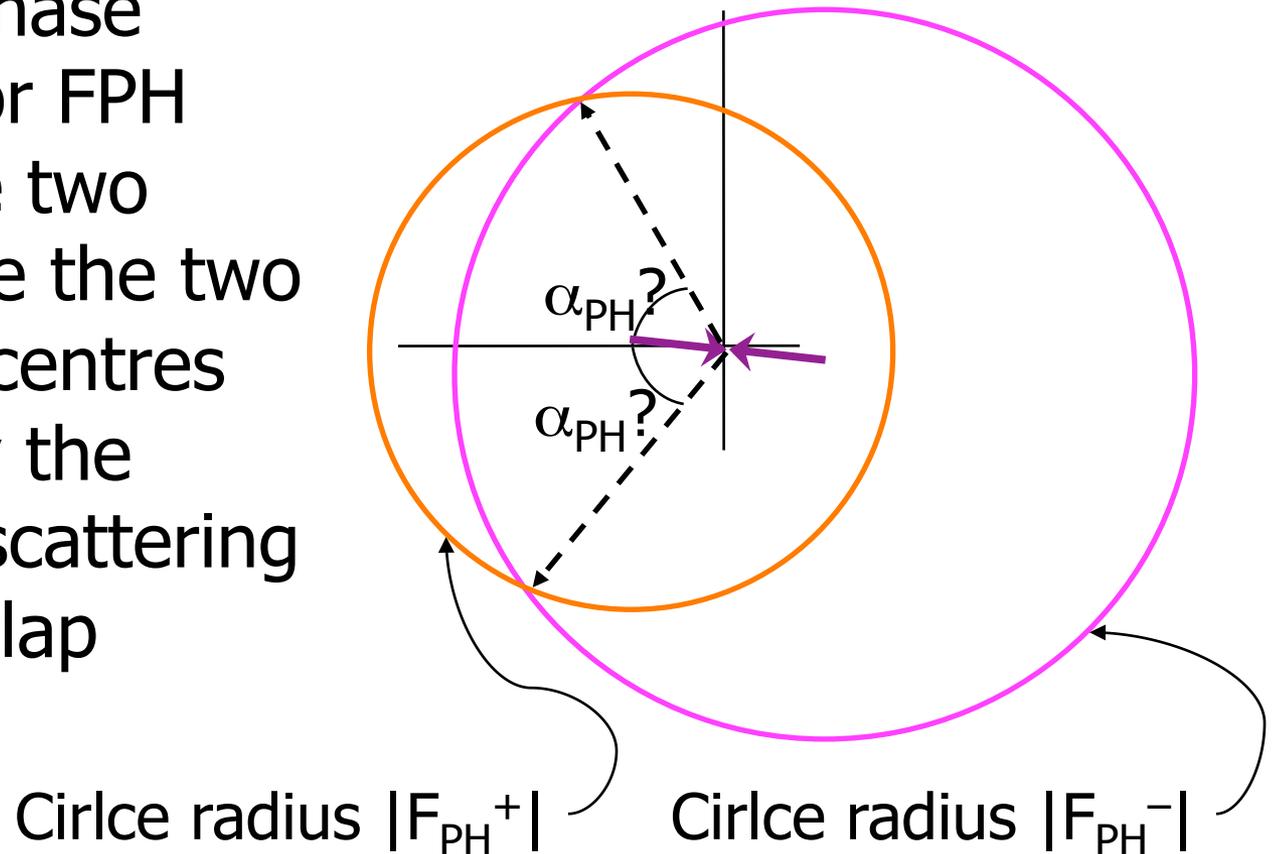

Non-anomalous part of heavy atom

Protein (non-anomalous scattering)

- It is easier/usual to use the complex conjugate of all Friedel F^-
 - i.e. all structure factors for $(-h, -k, -l)$
 - Phase $F_{PH}(\alpha_{PH})$

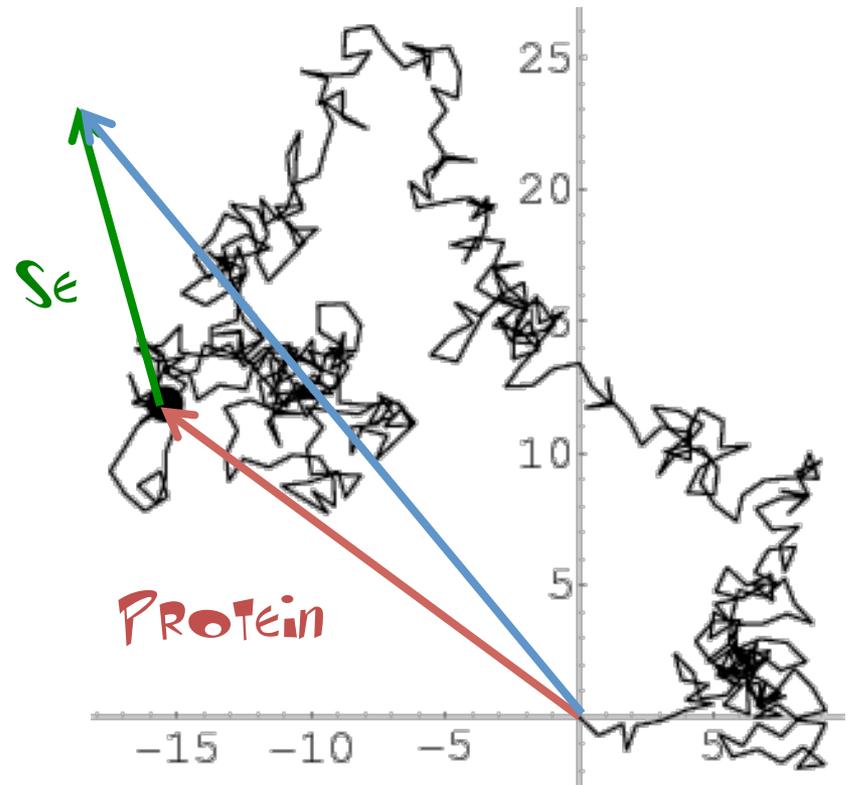

SAD Harker Diagram

- There is a phase ambiguity for FPH given by the two places where the two circles with centres displaced by the anomalous scattering vectors overlap

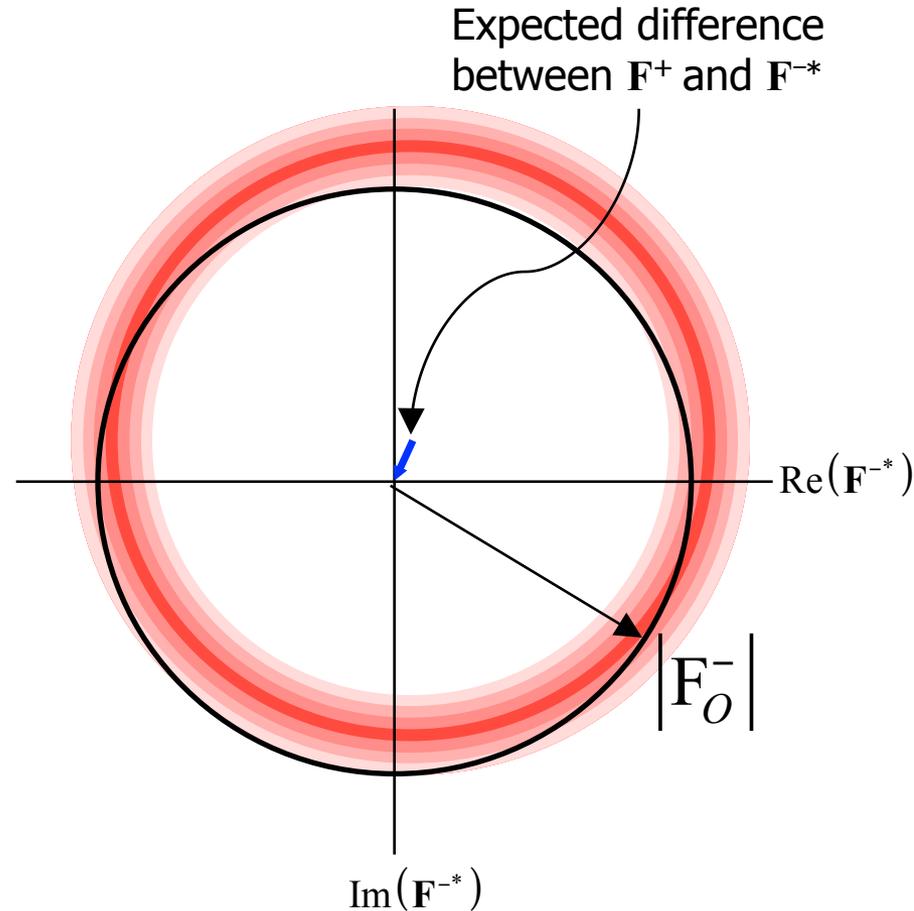

Partial Structure

- But there is more phase information!
- The anomalous scatterer is also a part of the structure
 - Gives additional phase information
 - Begins to break phase ambiguity

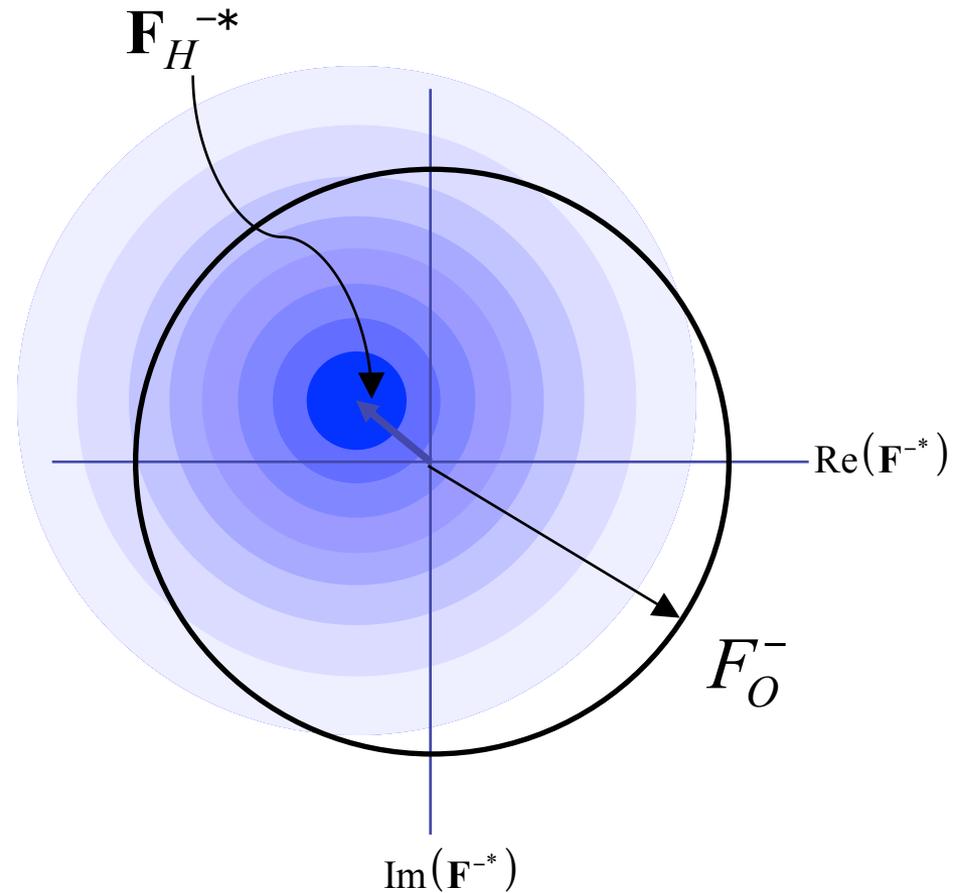

SAD Phasing

- Primarily anomalous scattering
- Gives a narrow probability distribution

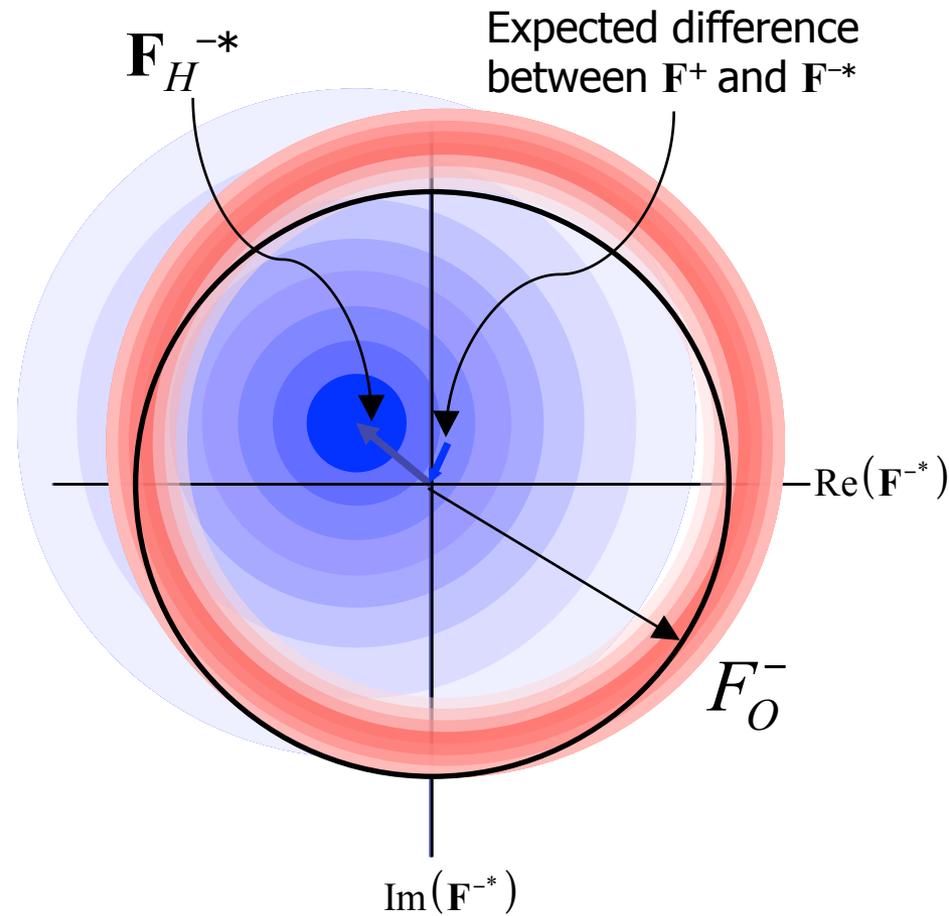

SAD Phasing

- Primarily Normal scattering
- Gives a broad probability distribution

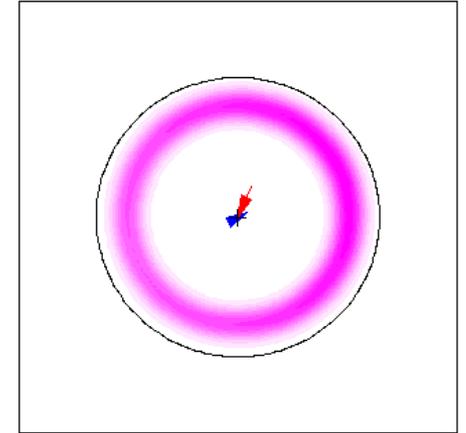

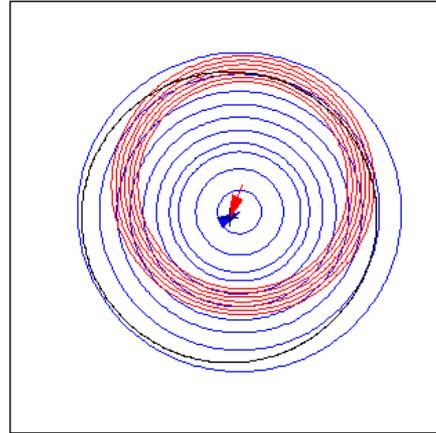

SAD Phasing

- Likelihood is proportional to the product of the two distributions (magenta) under the black circle

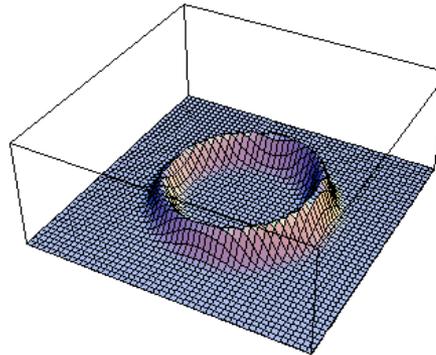

Refining Occupancy

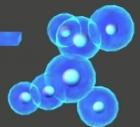

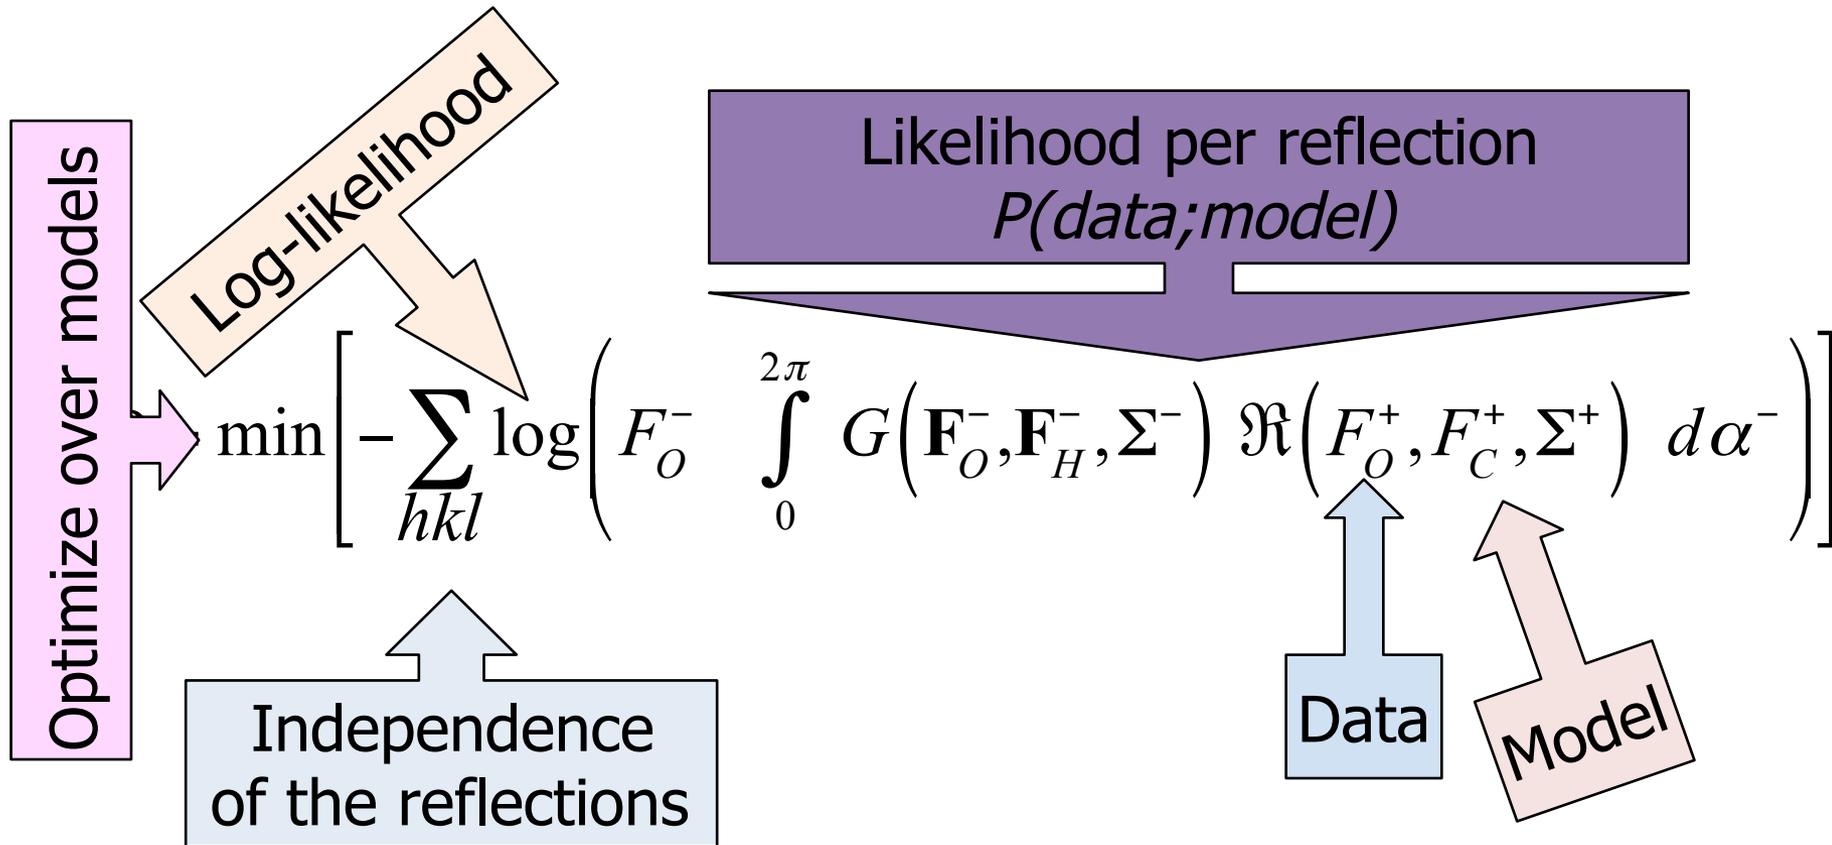

To refine the occupancy of a heavy atom, maximise the SAD likelihood

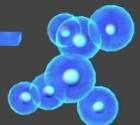

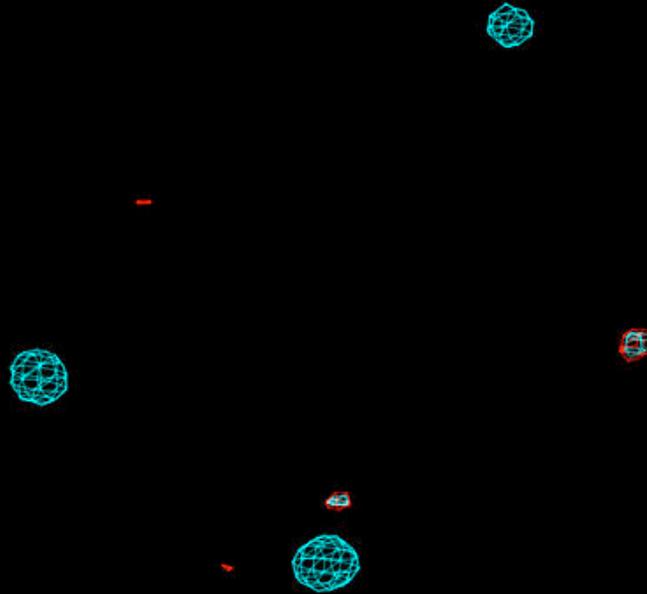

Final refined value is the optimum for ALL reflections (movie shows ONE reflection)

Correlated SAD Likelihood Function

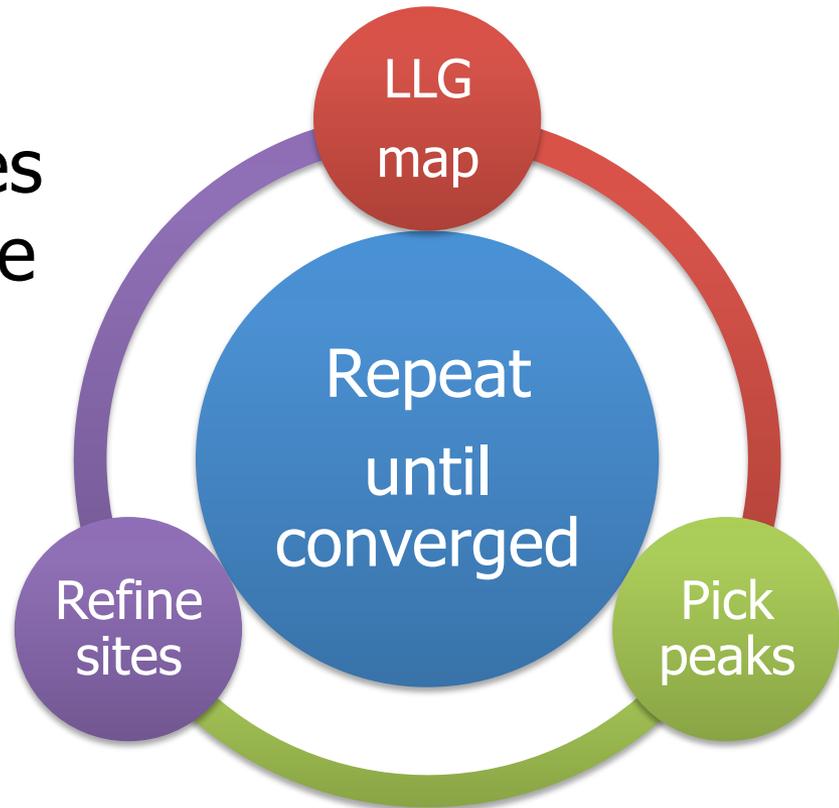

Log-likelihood gradient maps

Completion of sub-structure

- LLG maps are very sensitive
- Inclusion of minor sites **greatly improves** the phases
- Could include all intrinsic sulphurs
- Also finds bound halides

Thyroxine binding globulin

Where does
thyroxine bind?

Thyroxine contains
4 iodine atoms

Two molecules in
asymmetric unit

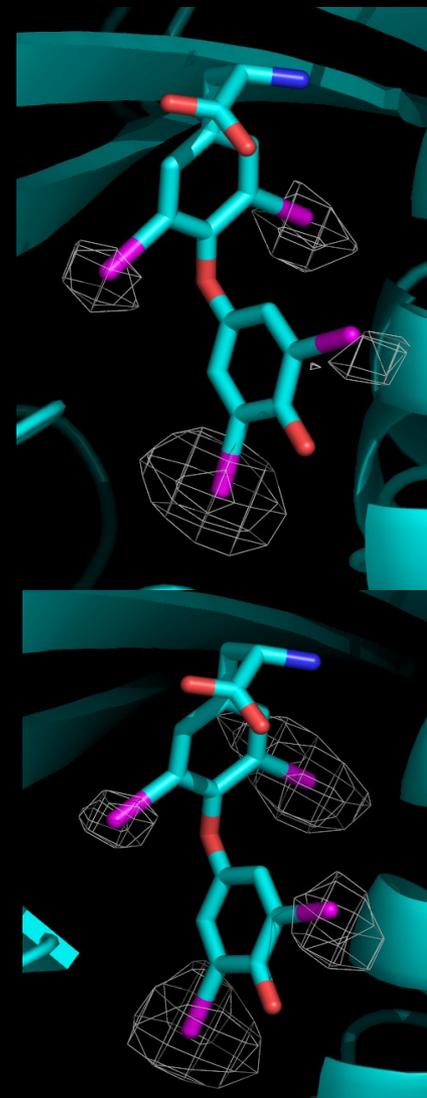

$d_{\min} = 2.8 \text{ \AA}$

$\lambda = 0.979 \text{ \AA}$

$f'' \approx 3e^-$

Calculating Electron Density

- ML function is good for refining the parameters, but what phase should be used in the electron density equation?
 - Have to pick one phase
 - **We want the phase that gives the electron density with the lowest rms error**
 - Parseval's theorem relates the rms error in real space to the rms error in reciprocal space and vice versa
 - This phase (the "**best phase**") is the probability-weighted average of all the phases
 - It is not the "most probable phase"
-

- Cut the centre out of a polystyrene foam plate
- Balance the disk on your finger
 - The centre of mass is at the centre
- Now put 3 paperclips on the edge of the disc
 - 2 together
 - 1 a distance away
- The balancing point is **between** the 3 paperclips
 - Not on the 2 paperclips

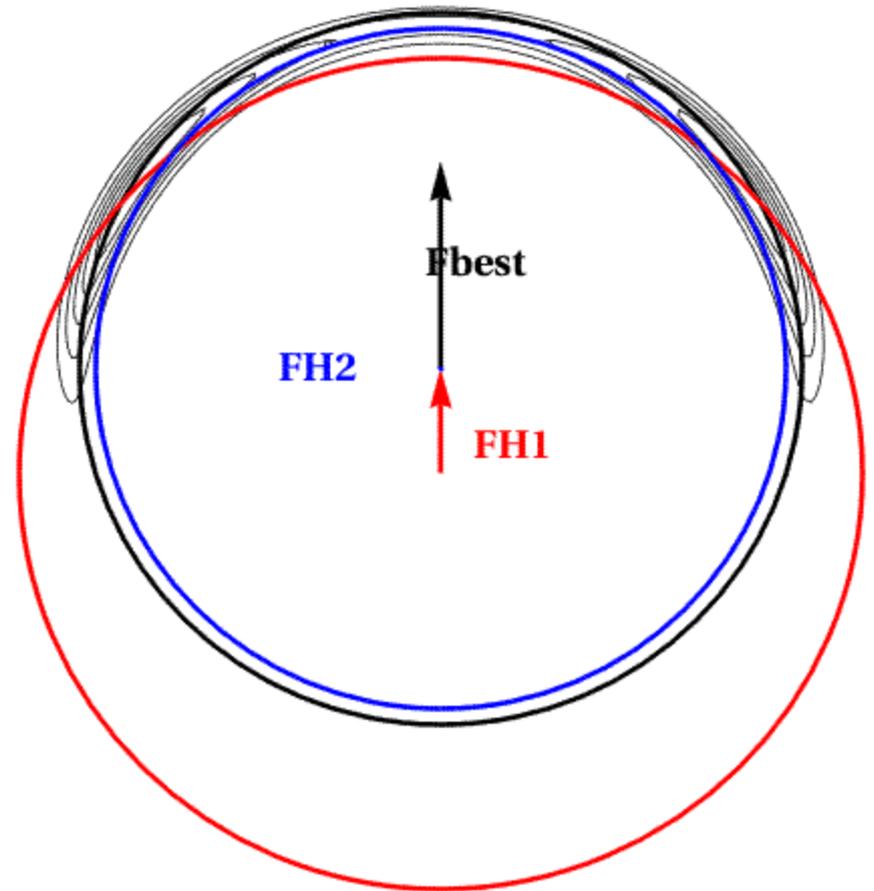

Most
Probable
Structure
Factor

Best
Structure
Factor

- F_{best} has a lower $|F|$ amplitude than F_{obs}
- The reduction in F_{obs} to give F_{best} is expressed as the “figure of merit” (m)
 - **$0 < m < 1$** : F_{best} lies inside the F_{obs} circle
 - **$m = 1$** : Perfect phase information
 - **$m = 0$** : No phase information
 - The higher the average value of the figure of merit, the better

New approaches

The pathway of structure solution

- Historically, there has been a linear progression through structure solution
- You had to be sure each step is correct before progressing to the next
- When signal is low you cannot be sure (of anything)

Find
substructure

```
graph TD; A[Find substructure] --> B[Complete with LLG maps]; B --> C[Density modification]; C --> D[Model building];
```

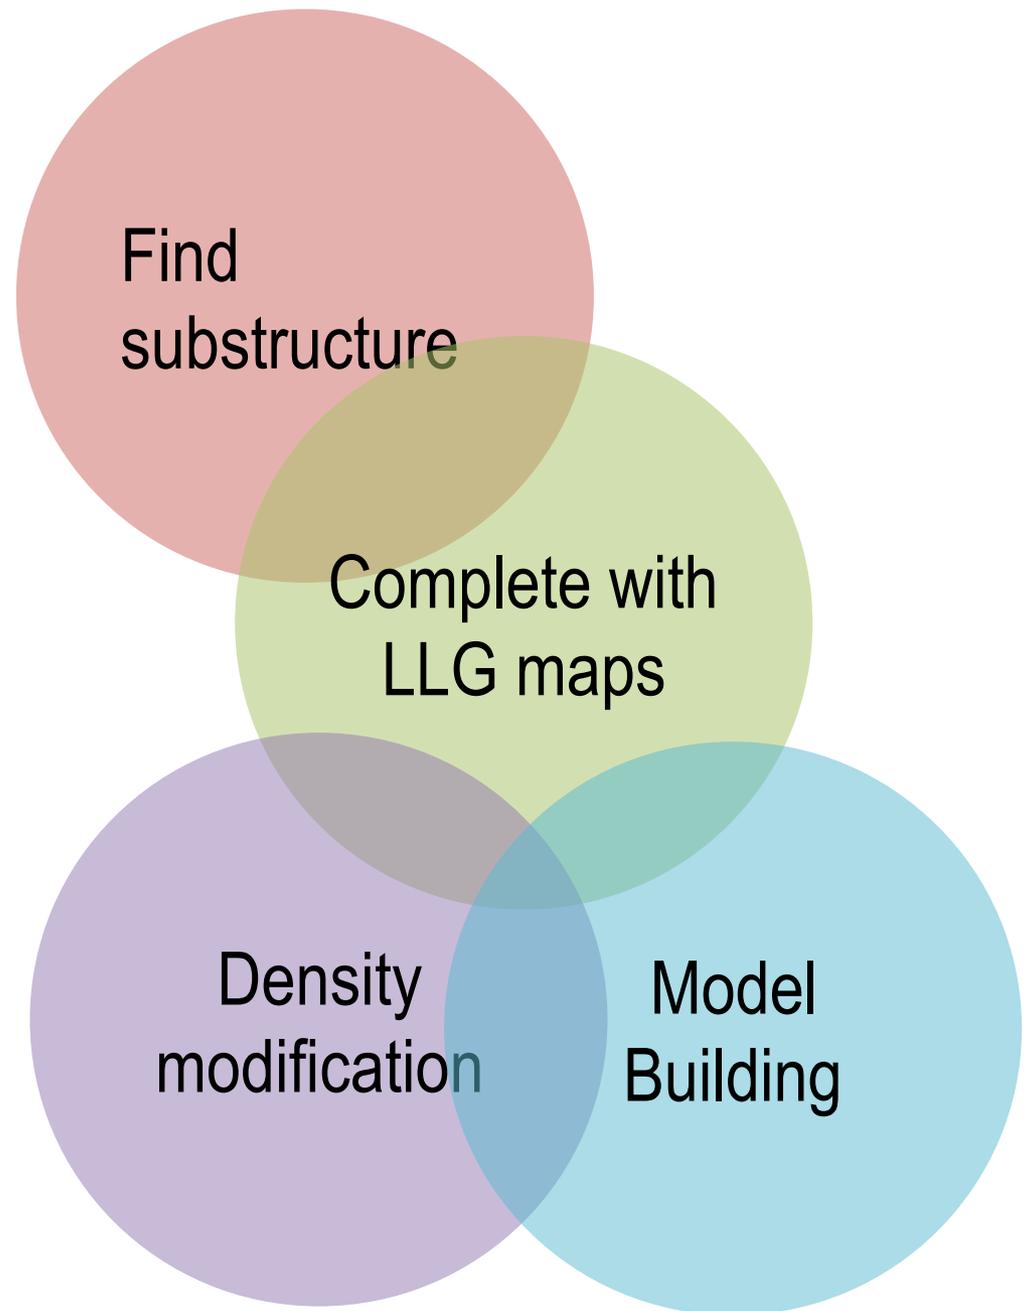

Complete with
LLG maps

Density
modification

Model building

New approaches

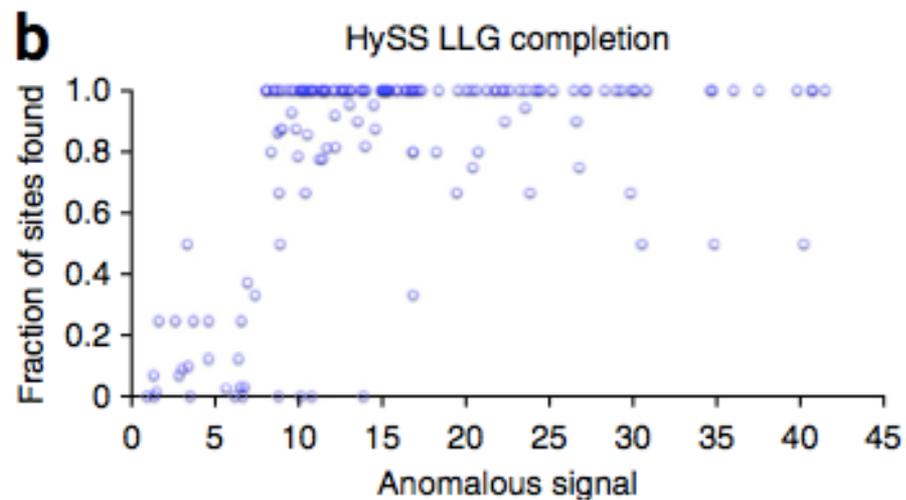

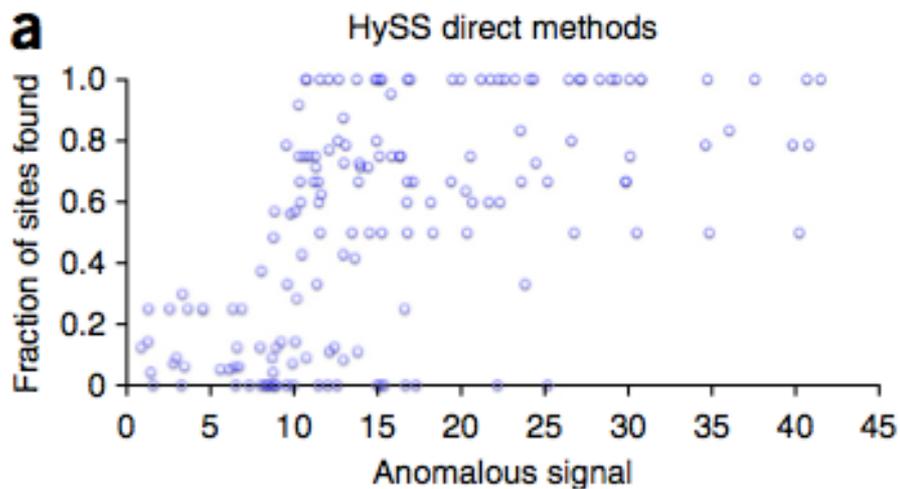

- Take multiple possibilities for each step and uses subsequent steps to distinguish correct from incorrect solutions
- Enables structure solution when signal is low
